

Day 18 Assignment
By M Mary Margarette
On 16-02-2022

What is the use of XML

- Xml is used to transferred data mechanism to send data across different forms.
- Xml was designed to store and transport data.
- It simplifies data transport.

Write the points discussed about xml in the class

- Xml has only single root tag.
- It can have any no. of tags in root tag.
- Xml stands for Extensible Markup Language.
- Xml is case sensitive.
- Xml is used for universal data transfer mechanism to send data across different platforms.
- Xml will have user defined tags.

Create a simple xml to illustrate:
a. Tag based xml with 10 products
b. Attribute based xml

Tag Based xml with 10 products

Tag.xmlAttribute.xml

File | C:/Users/JESUS/OneDrive/Desktop/Tag.xml

This XML file does not appear to have any style information associated with it. The document tree is shown below.

```
<Products>
  <Gadgets>
    <ID>156</ID>
    <Name>Mobile</Name>
    <Brand>IPhone</Brand>
  </Gadgets>
  <Gadgets>
    <ID>148</ID>
    <Name>TeleVision</Name>
    <Brand>Hitachi</Brand>
  </Gadgets>
  <Gadgets>
    <ID>186</ID>
    <Name>Laptop</Name>
    <Brand>Dell</Brand>
  </Gadgets>
  <Gadgets>
    <ID>187</ID>
    <Name>Speaker</Name>
    <Brand>JBL</Brand>
  </Gadgets>
  <Gadgets>
    <ID>122</ID>
    <Name>Bluetooth Earphones</Name>
    <Brand>Sony</Brand>
  </Gadgets>
  <Gadgets>
    <ID>166</ID>
    <Name>Camera</Name>
    <Brand>Panasonic</Brand>
  </Gadgets>
  <Gadgets>
    <ID>153</ID>
    <Name>Tablet</Name>
    <Brand>Samsung</Brand>
  </Gadgets>
  <Gadgets>
    <ID>141</ID>
    <Name>Smart Watch</Name>
    <Brand>Boat</Brand>
  </Gadgets>
  <Gadgets>
    <ID>177</ID>
    <Name>Wireless Mouse</Name>
    <Brand>Logitech</Brand>
  </Gadgets>
  <Gadgets>
    <ID>178</ID>
    <Name>Wireless Keyboard</Name>
    <Brand>Intel</Brand>
  </Gadgets>
</Products>
```

Attribute based xml

Tag.xmlAttribute.xml

File | C:/Users/JESUS/OneDrive/Desktop/Attribute.xml

This XML file does not appear to have any style information associated with it. The document tree is shown below.

▼<Products>

<Product ID="189" Name="Shirt" Brand="Lee Cooper"/>

<Product ID="190" Name="T-Shirt" Brand="Marvel"/>

<Product ID="191" Name="Trouser" Brand="Pepe Jeans"/>

<Product ID="192" Name="Jean Pant" Brand="DNMX"/>

<Product ID="193" Name="Tunics" Brand="Zudio"/>

<Product ID="194" Name="Tops" Brand="Max"/>

<Product ID="195" Name="Kurti" Brand="Jaipur Kurti"/>

<Product ID="196" Name="Suit" Brand="Raymond"/>

<Product ID="197" Name="Chappals" Brand="Skechers"/>

<Product ID="198" Name="Shoes" Brand="Nike"/>

</Products>

Convert the above xml to JSON and display the JSON data

Tag Based xml with 10 products

```
{
  "Products": {
    "Gadgets": [
      {
        "ID": "156",
        "Name": "Mobile",
        "Brand": "iPhone"
      },
      {
        "ID": "148",
        "Name": "Television",

    },
    {
        "-ID": "197",
        "-Name": "Chappals",
        "-Brand": "Skechers"
    },
    {
        "-ID": "198",
        "-Name": "Shoes",
        "-Brand": "Nike"
    }
]
},
"#omit-xml-declaration": "yes"
}

```

Research and write the benefits of JSON over XML (2 or 3 points)

- JSON is faster because it is designed for data interchange only. XML is slower because it is designed for a lot more than just data interchange.
- JSON occupies less memory than XML.
- JSON is a light weight data exchange format Where XML parsing always consumes lot of browser resources.
- JSON is easy and faster to parse when compared to XML.

For the below requirement, create a layered architecture project with separate class library for Business logic.

create console application

create windows (or desktop) application

Business Requirement: FINDING FACTORIAL OF A NUMBER:

0 = 1

positive number (up to 7) = factorial

> 7 = -999 (as answer)

< 0 = -9999 (as answer)

put the screen shots of the output and project (solution explorer) screen shot

Console Application

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;

namespace Mathematics
{
    1 reference
    public class Algebra
    {
        1 reference
        public static int Factorial(int n)
        {
            int fact = 1;

            if (n == 0)
            {
                return 0;
            }
            else if (n > 7)
            {
                return -999;
            }
            else if (n < 0)
            {
                return -9999;
            }
            else
            {
                for(int i = 1; i <= n; i++)
                {
                    fact = fact * i;
                }
                return fact;
            }
        }
    }
}
```

```
Algebra.cs  Program.cs  [icon] [x]
C# Day 18 Project 1  Day_18_Project_1.Program
1  using System;
2  using System.Collections.Generic;
3  using System.Linq;
4  using System.Text;
5  using System.Threading.Tasks;
6  using Mathematics;
7
8  namespace Day_18_Project_1
9  {
10     internal class Program
11     {
12         static void Main(string[] args)
13         {
14             int n;
15             Console.WriteLine("enter number :");
16             n=Convert.ToInt32(Console.ReadLine());
17             Console.WriteLine(Algebra.Factorial(6));
18             Console.ReadLine();
19         }
20     }
21 }
```

Console Application Output:

E:\NH Assignments\Day 18 Assignment by Mary Margarette on 16-02-2022... [icon] [x]

```
enter number :
6
720
```

Windows Form Application:

```

using System;
using System.Collections.Generic;
using System.ComponentModel;
using System.Data;
using System.Drawing;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using System.Windows.Forms;
using Mathematics;

namespace WindowsForm
{
    3 references
    public partial class Form1 : Form
    {
        1 reference
        public Form1()
        {
            InitializeComponent();
        }

        1 reference
        private void button1_Click(object sender, EventArgs e)
        {
            int n = Convert.ToInt32(textBox1.Text);
            int result = Algebra.Factorial(n);
            textBox2.Text=result.ToString();
        }
    }
}

```

Windows Form Application Output:

The screenshot shows a Windows Form application titled "Form1". The form has a light gray background. It contains two text boxes: "Enter Number" with the value "5" and "Result" with the value "120". A button labeled "Factorial" is positioned between the two text boxes. The window has standard Windows controls (minimize, maximize, close) in the top right corner.

For the above method, Implement TDD and write 4 test cases and put the code in a word document.

put the screen shot of all test cases failing.

make the test cases pass.

put the screen shot.

Add one more method to check if the number is palindrome or not in the above Algebra class and write test case for the same.

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;

```

```

namespace Palindrome
{

```

```
public class Class1
{
    public static string Palin(int n)
    {
        int sum = 0, rem;
        int temp = n;
        while (n > 0)
        {
            rem = n % 10;
            sum = sum* 10 + rem;
            n = n / 10;
        }
        if (temp == sum)
            return "Palindrome";
        else
            return "Not Palindrome";
    }
}
```

```
using System;
